Grow & Care

Stage 5: Heuristic evaluation

Usability heuristics – J. Nielsen

N°	Problem	Heuristic	Description	Severity	Solution	Screenshot
1	"Next" button partially or totally hidden in Mood Quest	Visibility of System Status, User Control & Freedom	The user cannot scroll down to reach the "Next" button and must instead scroll horizontally, which is unexpected. At the last step of the Mood Quest (where clicking on next is necessary in order to proceed), only the top part of the button is visible, making it hard to notice and click.	3-major	either modify the page structure to make the button fully visible or enable vertical scrolling	
2	Bondie section not enough visually emphasized	Aesthetic and Minimalist Design	The Bondie icon is visible and accessible, but it is not highlighted enough compared to the importance of the content it provides. Since a significant portion of the app's content is available through Bondie, increasing its visual emphasis could help users better recognize its relevance and encourage more frequent interaction.	2-minor	While it is positive that Bondie is always accessible as an icon (also from the calendar, couple section, settings, etc.), its importance could be better communicated. This could be achieved either by giving it more visual prominence on the homepage or by assigning it a dedicated tab, making its role within the app clearer and more central.	

3	Unclear submission process for Time Capsule	Recognition Rather Than Recall	When creating a Time Capsule, it is not clear that submission is performed by clicking on Bondie. This step is not indicated textually and differs from common interaction patterns, where users expect a visible "Submit" or confirmation button. As a result, users must infer the correct action without guidance, which may lead to confusion and incomplete task execution.	3-major	Add a clear visual indication or call-to-action explaining that Bondie must be clicked to submit the Time Capsule (e.g., "Submit via Bondie"). Alternatively, include a dedicated "Submit" button to make the action explicit.	
4	Calendar not well-scaled	Visibility of System Status, Flexibility & Efficiency of Use	When the user is in the "Sort by Week"-view of the calendar, only around 4 hours of each day are visible, which is not very convenient, since 1: a day might look free even though it is not, and 2: one has to scroll a lot to see when events are scheduled.	1-minor	Rescale the y-axis of the calendar, so that more of each day fits on the screen.	

Note: We are aware of the fact that our table is pretty short. This is simply due to the fact that 'Bonded' already appears to comply with the given heuristics almost perfectly. All of our team members looked through the app very thoroughly, but we could not come up with more problems than the ones listed above.

Received project: 24.11.2025

Delivered evaluation: 30.11.2025
